#### Model Driven Software Engineering (MDSE)

## **Using Model-Driven Engineering** to Support Safety Assurance

**Software Engineering and Technology (SET) Group**

#### Figure 2. Generic use of our approach

An overview of our approach is shown in the Figure 1. We begin with GMM, then if needed, some domain concepts can be introduced into it. To support it, a MetaModel Refine Language (MMRL) is defined [3]. It is a simple domain specific language, which allows the user to describe their domain concepts using the provided operators. After this, a metamodel transformation could be executed to get SMM. Finally, a graphical editor, based on the SMM, could be automatically generated, which facilities the user to build their models using those concepts from their own domain. According to different scenarios, our approach can be divided into two steps: updating and specialization (shown in Figure 2).

#### **Objectives**

One of the key challenge of this project is to define a common certification framework as a core for specifying certification assets. As a result, a Generic MetaModel (GMM) of safety standards has been built [2], which allows patterns of certification assessment to be shared and supports cost-effective re-certification between different standards. Because the concepts in GMM are generic, it will bring some extra cost to interpret them and some ambiguities when using them. To address this, Specific MetaModel (SMM) is proposed.

### Implementation

### Conclusion

We present a model-driven engineering approach to facilitate safety assurance. By using this framework, domain concepts or project related concepts can be kept, users do not need to change their current way of working, and the traceability from GMM to SMM is maintained using our MMRL. Besides, it could be used for mapping between different specific metamodels [4].

Figure 4. A company X model editor

We have implemented our approach using Eclipse Modeling Framework with certain plug-ins. For our domonstrations, we use two case studies: ISO 26262 and company X. Our key results are two different editors, which are shown in Figure 3 and Figure 4. In the two different eidtors, different domian concepts are added to the GMM.
